

Mobile App Wireframing: GoalTrack

Low-Fidelity Architecture, User Flow Mapping & Design Thinking Process

Project: GoalTrack (Habit & Workflow Tracker) **Design Tool:** Figma **Target Viewport:** Mobile (iOS / Android)

1. Project Overview & User Research

Problem Statement: Developers and students often struggle to maintain consistent daily technical habits (such as reviewing pull requests, updating documentation, and releasing milestones) because traditional project management platforms are heavy, desktop-oriented, and cognitively fatiguing.

Research Finding: Mobile habit adoption increases by over 60% when the initial onboarding immediately prompts user activation (creating the first goal) rather than leaving the user with an empty, passive dashboard. Reducing setup friction to a single form bridges the gap between daily intent and project execution.

Target Audience: Junior software developers, engineering students, open-source contributors, and knowledge workers seeking targeted accountability.

2. Target User Persona

Alex Rivera (Age 23)

Junior Full-Stack Developer & Computer Engineering Student

Core Goals:

- Build consistent daily momentum across GitHub repositories.
- Never miss critical pull request reviews or documentation updates.
- Quickly visualize weekly goal completion without logging into desktop suites.

Frustrations & Constraints:

- Existing productivity tools have overwhelming feature bloat.
- Mobile layouts are often cluttered with nested submenus.
- Blank dashboards on initial sign-up cause immediate drop-off.

3. End-to-End User Flow Architecture

The low-fidelity wireframe sequence follows a 5-screen linear activation journey designed to take the user from registration to actionable progress visualization:

1 Onboarding Screen (Value Proposition)

Welcomes the user, highlights key value pillars (Set targets, Track progress, Stay motivated), and provides an immediate **Get Started** call-to-action button.

2 Sign Up Screen (Account Registration)

Captures core credentials: Full Name, Email Address, Password, and Password Confirmation. Clean vertical form layout optimized for mobile thumb typing.

3 Set a New Goal Screen (Initial User Activation)

Direct post-signup onboarding step. Prevents the "blank slate" problem by prompting the user to name their first goal, add a short context description, and set a realistic target deadline.

4 Home Dashboard Screen (Daily Workflow & Status Hub)

Personalized greeting ("Hi, Nikhil!"), high-level daily momentum metrics (Completed vs. In-Progress counters), and quick-action status badges (Done, On Track, Needs Work, Blocked).

5 Progress Screen (Analytics & Velocity Visualization)

Dedicated quantitative screen displaying bar charts of GitHub workflow velocity, milestone metrics, and completion summaries over time.

4. Design Thinking Framework

Stage 1: Empathize

Interviewed and observed developers balancing coding projects. Discovered that friction in tracking tasks causes workflow fragmentation.

Stage 2: Define

Formulated the design question: *"How might we create a mobile tracking experience that feels as lightweight as checking a commit log?"*

Stage 3: Ideate

Prioritized a single-card layout, high-contrast task badges, and an immediate goal-setting step preceding the main dashboard.

Stage 4: Prototype (Figma Wireframing)

Built 5 low-fidelity screens with consistent 440px mobile canvas containers, standardized button heights (48px touch targets), and structured typography.

Stage 5: Validate & Test

Connected screen transitions via Figma Prototype player (On Tap → Navigate To) to test flow logic and verify interaction pacing.
